

Missouri Senior Report 2009

Welcome to the Missouri Senior Report 2009

Missouri Senior Report 2009 is a collaborative effort by the Missouri Department of Health and Senior Services (DHSS) and the University of Missouri Office of Social and Economic Data Analysis (OSED) to inform state and local audiences about the contributions and needs of seniors in Missouri.

In addition, this report would not have been possible without the assistance and support of the ten Missouri Area Agencies on Aging and the Missouri Senior Report Advisory Committee.

This report can be accessed online at:

Dear Fellow Missourians:

By mid-century, seniors will outnumber children and youths for the first time in history.

Our state is the only one in the nation that issues an annual report on the status of seniors. We can all be proud of our efforts.

We rolled out our first senior report in 2006, and this year's version offers something new — a personal story about a 91-year-old woman and her son who benefitted from a senior service tax levy. The feature demonstrates the ingenuity of counties across Missouri as they adapt to and support their growing senior population. The report continues to provide county-level data and other information to help state and local policymakers, service providers, and seniors themselves plan for future needs.

One of the highest priorities for the Centers for Disease Control and Prevention is to increase the number of older adults who live longer, healthier lives. The Department of Health and Senior Services shares that priority. We believe *Missouri Senior Report 2009* is an important tool in achieving that goal.

The Department of Health and Senior Services and the University of Missouri Office of Social and Economic Data Analysis collaborated to bring you this fourth annual report. I am confident you can use it to meet our seniors' current needs and as a blueprint for the future.

Sincerely,

A handwritten signature in cursive script that reads "Margaret T. Donnelly".

Margaret T. Donnelly
Director

Introduction

The number of Missourians age 65 and older is projected to grow by some 450,000 over the next 15 years, bringing the total number of seniors to an estimated 1,255,000. This growth will increase the proportion of seniors in the state's population from an estimated 13.6 percent today to 15.1 percent by 2015 and to 19.1 percent by 2025. As the baby boomers age, their values and life experiences will influence Missourians' perceptions of the resources, needs, capacities and strengths of seniors. *Missouri Senior Report 2009* is a resource to inform state and local policy makers, service providers and families, as they plan for the impact of an increasingly older Missouri.

The report provides a snapshot of the status of Missouri seniors. It addresses their economic well-being, household and community engagement, health care status and access to medical treatment. The report also includes annual population projections and evaluations of seniors' quality of life and wellness. It includes articles on Missouri's senior tax levies and health disparities among seniors.

Trend data are available for eight indicators. Statewide, Missouri has improved on four of these indicators between 2000 and 2008. Improvements are noted in workforce participation, housing, transportation and health care access. The economic well-being indicator has remained relatively constant. Trends declined for household composition, long term-care costs and health status. The economic contribution, civic engagement and safety indicators were created just last year, making a trend analysis not yet meaningful.

Trends in the eight indicators vary throughout the state, reflecting the state's demographic diversity. The county populations range from nearly one million in St. Louis County to about 2,000 in Worth County. Changes in population patterns also vary greatly. Between 2000 and 2008, Christian County, sandwiched between Springfield and Branson, grew by an estimated 37 percent in total population and 45 percent in senior population. In contrast, Worth County in northwest Missouri experienced almost a 14 percent decline in total population and a 4 percent decline in the number of seniors.

Missouri includes counties that are urban, suburban or rural. That character greatly affects each county's economy, culture and senior population. For instance, seniors in Missouri's most rural counties, particularly those in northern Missouri, tend to be older and more reliant on retirement income than seniors in more populated areas. Seniors in Missouri's metropolitan counties are more likely to have convenient access to health care, access to transportation, and participate in the workforce. To address this diversity, the report presents comparative information for individual Missouri counties. The report ranks each county on annually updated outcome indicators. It also includes an overall county composite rank – a summary index of the overall well-being of seniors by county. To place these annual outcome measures in the broader community context,

Introduction

“status” indicators describe the demographic composition, quality of life, and health and wellness of seniors.

Understanding Senior Report Outcome and Status Indicators

The senior report indicators present an annual snapshot of each of Missouri’s counties. The indicators and measures were selected through input from many Missourians with a personal or professional passion for the well-being of seniors. The senior report advisory committee provides ongoing input into the report’s structure and content. One of its subcommittees selected the topics and authors for this year’s articles.

The *Missouri Senior Report 2009* is located on the Web at: www.missouriseniorreport.org. It features the content in the printed report and allows users to access data used to calculate the outcome and status indicators. For example, the population estimates can be viewed by age and gender. The data, provided in both tabular and graphic format, can be viewed online and downloaded. The ‘County Profile Tables’ feature (accessible under ‘Quick Links’) allows users to select a specific county and browse tabular data by outcome and status indicators. The ‘Dynamic Reports Generator Menu’ (accessible by clicking on the ‘Data’ icon located in the header) allows users to select multiple counties, years and indicators to produce downloadable tables and graphs for use in presentations and reports. Previous senior reports are archived and accessible at the site. You may also access a print-ready version of *Missouri Senior Report 2009*.

Indicators

Missouri Senior Report 2009 is organized around “outcome” and “status” indicators. Outcome indicators measure progress over time. Tracking trends in those indicators can help improve the health, social, and economic well-being of Missouri seniors. Counties are ranked by each outcome indicator. The indicator rankings are combined to compute the composite outcome ranking. Status indicators present demographic, quality of life, and health status measures for a single point in time.

The composite index ranking is based on the sum of the standardized values for nine of the outcome measures. It represents an overall measure of the well-being of seniors. The purpose of the ranking is to help focus improvement on local factors that contribute to the quality of life of Missouri seniors.

Outcome and status measures are tested for statistical reliability and validity. Because outcome indicators are measured annually, they are collected from various sources, including state administrative records such as the Missouri Board of Healing Arts and the Missouri Department of Social Services, and federal reporting agencies such as the U.S. Census Bureau and the Bureau of Labor Statistics.

Introduction

Status indicators describing population characteristics are derived from the U.S. Census Bureau. Health and wellness indicators are drawn from the Center for Disease Control Behavioral Risk Factor Surveillance Survey (BRFSS) instrument. The health and wellness indicators are available through a Missouri Department of Health and Senior Services and Missouri Foundation for Health partnership. The glossaries of outcome and status indicators provide a detailed description of the construction and source of each measure.

Emerging Issues

The Office of Social and Economic Data Analysis conducted a 2008 survey to learn how the senior report is used in communities around the state and discover what features and information might be added to enhance the report's value. We learned the issues that concern seniors, their loved ones and caregivers. Missourians spoke to us about the cost of prescription drugs, the need for better transportation options and the desire for seniors to remain in their homes and communities as long as possible. We were told about the value of social engagement, the fear of under-reporting of elder abuse and financial exploitation and the need to prepare for the aging of the baby boom generation.

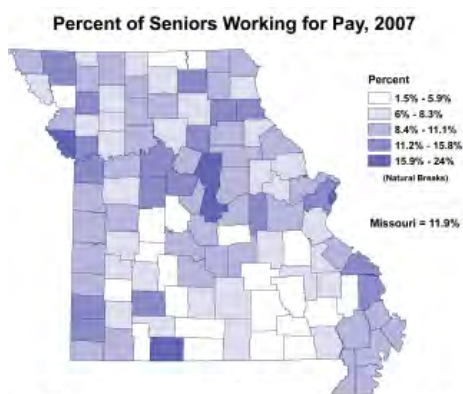

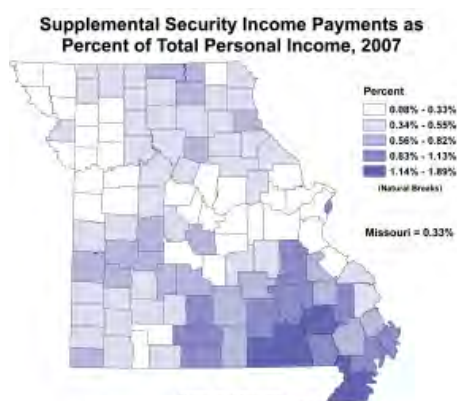

As *Missouri Senior Report 2009* goes to print, the United States continues to face a severe economic recession. High unemployment and mortgage defaults have led many people to deplete their retirement accounts. The recession has had a profound impact on seniors. This report begins to reflect the impact of the downturn. The value of an annual report is that it can reveal trends and allow policymakers to be informed as they address the concerns and desires of a community. We also want to know what you think of this report. Contact us at 573-884-5116 or via the Web at: www.MissouriSeniorReport.org.

Introduction

Outcome Indicators

Economic Well-being

Economic well-being for seniors can be measured by the percentage of seniors living in poverty. In 2000 the poverty rate for Missouri seniors was 9.9 percent, as compared to 10.9 percent nationally. While ACS poverty estimates for the senior population are now available annually at the state level, they will not be provided by the U.S. Census Bureau at the county level until 2011. However, Bureau of Economic Analysis county-level estimates on the numbers of low-income individuals and seniors who receive Supplemental Security Income (SSI) are available on an annual basis. Therefore, a relative index of economic well-being was created by calculating SSI payments as a percentage of total personal income. In Missouri, overall SSI payments represent 0.33 of one percent of total personal income, consistent with last year's estimate. By county, this index of economic well-being ranges from a high of nearly 2 percent in Pemiscot County to a low of under 0.10 of one percent in Platte and St. Charles counties.

Workforce Participation

Senior participation in the workforce may be viewed as either an adverse or a positive outcome. An adverse view may result if seniors work because they are strapped for cash and would prefer to be fully retired. If, however, seniors want to remain economically and socially engaged and are employed in service and retail jobs that do not require strenuous physical activity, the outcome can be viewed as positive. On balance, the advisory committee views an increase in senior workforce participation as positive. Senior participation in the Missouri workforce has increased from 9.8 percent in 2001 to 11.9 percent in 2007, after dipping to 8.2 in 2005. By county, senior participation in the workforce ranged from a low of approximately 1.5 percent in Douglas County to a high of 24 percent in Taney County in 2007.

Economic Contribution

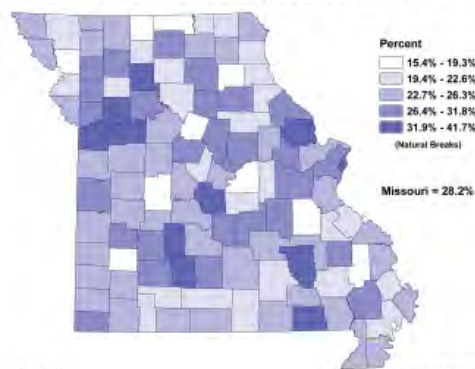

Seniors spend a great deal locally, frequently at higher rates than people younger than 65. This report includes a measure that provides the ratio of seniors' economic contribution relative to the proportion of seniors in a county's population. Overall, Missouri's seniors are responsible for about 15.8 percent of consumer expenditures, yet comprise 13.6 percent of the state's population. Seniors' economic impact ranged widely among counties. Seniors' spending accounted for 10.7 percent of all spending in St. Charles County, but more than 33 percent in Cedar County. In all but 11 Missouri counties, seniors' expenditures exceed the proportion of the senior population.

Introduction

Housing

The U.S. Department of Housing and Urban Development (HUD) considers families who pay more than 30 percent of their income for housing as ‘cost burdened’; these families may have difficulty affording necessities such as food, clothing, transportation and medical care. Housing costs include mortgage or rent, taxes, insurance and utilities. Seniors living on fixed incomes are particularly vulnerable to fluctuations in housing costs. On average, 28.2 percent of Missouri’s seniors are cost burdened. When considered by county, the number of seniors burdened by housing costs ranged from approximately 15.4 percent in Andrew County to 41.7 percent in St. Louis City.

Percent of Seniors Housing Cost Burdened, 2008

Transportation

Transportation is necessary in order to obtain goods and services and to participate in work and social activities. Whether seniors have the capacity to meet their transportation needs is often measured by how many hold a valid driver’s license. Transportation needs are also likely to vary, depending on the availability of mass transit. Whatever transportation arrangements seniors make, the lack of a driver’s license in Missouri indicates that transportation is an issue. The number of Missouri seniors with a valid driver’s license increased from 76.7 percent in 2001 to 84.2 percent in 2008. In suburban and rural counties with lower percentages of licensed senior drivers, transportation is likely to be a more pressing issue than in similar counties with higher percentages of senior drivers, or in more urbanized areas that have public and private transportation resources. In 2008, the percentage of Missouri seniors with a valid driver’s license ranged from a high of 95 percent in Benton, Camden, Cass, Daviess, Douglas, Ozark, Stone and Taney counties, to a low of 54.8 percent in St. Louis City.

Percent of All Seniors with Missouri Driver’s License 2008

Household Composition

The 2000 U.S. Census indicates Missouri had a relatively large proportion of seniors living in single person households. Seniors who live with someone are less likely to be socially isolated and may have help with many issues. Consequently, household composition is an important indicator for seniors’ well-being. Because census measures of single person households are not available annually, the percentage of seniors filing joint Missouri income tax returns was used to gauge household composition. Between 2001 and 2007, the number of seniors filing joint income tax returns declined from 44.7 to 39.9 percent. In 2007 the number of seniors filing joint returns ranged from a high of 52.9 percent in Pulaski County to a low of 25.3 percent in Knox County.

Seniors Living in Families, 2008

Introduction

Civic Engagement

Seniors contribute to their communities through a wide range of civic, humanitarian and religious volunteer activities. Capturing these activities consistently across counties and over time remains a challenge. However, we can know the degree to which seniors participate in the most fundamental of democratic activities – voting. Civic engagement is measured using the number of seniors as registered voters and as participants in elections on an annual basis. In 2008, Sullivan County seniors were registered to vote and voted at the highest rate, while Howell County seniors had the lowest rate of voter participation.

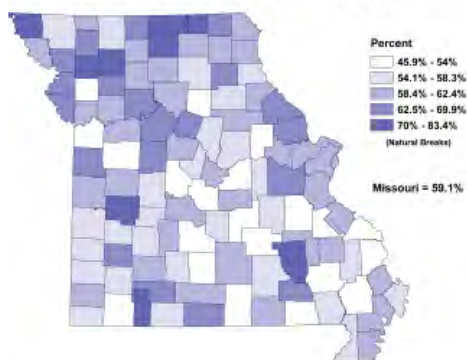

Long-Term Care

Long-term care represents a significant health care cost for seniors, who tend to have limited incomes, and for Missouri because of MOHealthNet (Medicaid). The number and value of long-term care insurance policies would be a useful measure for this indicator. However, that information is not reported by county. Consequently, this report presents the portion of long-term care costs paid by Medicaid for in-home and institutionalized long-term care services per capita. This annual measure shows the trend, if not the full expense, of long-term care. Long-term care costs increased from \$122 per capita in 2000 to \$143 per capita in 2008. However, both health care costs and the percentage of people eligible for Medicaid vary greatly by county. Therefore, this indicator is not used in the construction of the overall county index of senior well-being.

Safety

Understanding the relationship between seniors and safety is complicated. As with all populations, seniors are at risk of becoming victims of property and violent crimes. However, seniors who are physically or psychologically vulnerable are at increased risk of suffering accidents and abuse within their own homes. While crime data by age of victim is unavailable, we can measure the overall crime rate in a county. For the safety indicator, we included cases of abuse and neglect as reported through the Missouri Department of Health and Senior Services' Elder Abuse and Neglect Hotline. These combined data sources are reported as an indexed rate per 1,000 persons. Carroll County experienced the lowest crime and senior abuse incidents in 2008, occurring at a rate of 11.1 per 1,000 persons, while St. Louis City experienced the highest rate of 83 per 1,000 persons. Accordingly, the number of property and violent crimes per 1,000 persons is reported as an outcome measure. The Missouri overall crime rate declined from 48.8 in 2001 to 43.1 in 2008. In 2008 the crude crime rate ranged from a low of 4.4 crimes per 1,000 persons in Chariton County to a high of 115.2 in St. Louis City.

Senior Safety Index, 2008

Introduction

Hospitalization and ER Visits for Diabetes per 10,000 Seniors
2005 - 2007

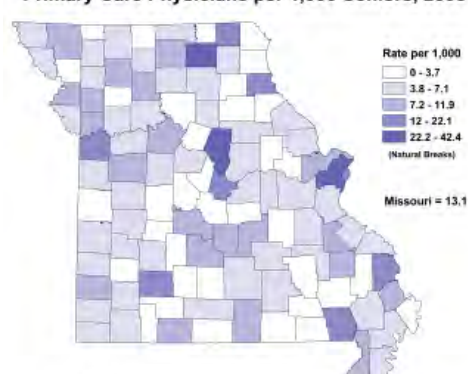

Health Status

Selecting one health status measure for the senior population is particularly difficult because of the wide range of health issues confronting seniors. The Missouri Department of Health and Senior Services tracks numerous health and mental health indicators to inform communities of health status needs. The senior report advisory committee decided to base this indicator on the “number of hospitalizations and ER visits for diabetes, averaged over three years per 10,000 seniors.”

Tracking diabetes-related care is a valuable proxy for health status because (a) the number of cases by county is sufficient to produce a reliable rate; (b) diabetes is related to many other health problems; and (c) effective preventive measures can reduce the incidence of diabetes and related health problems. The rate of diabetes hospitalizations and ER visits per 10,000 seniors in Missouri increased slightly, from 71.6 in 2002 to 72.6 in 2006. In 2006 the rate ranged from a high of 166.1 per 10,000 seniors in Pemiscot County to 6.7 in Worth County.

Primary Care Physicians per 1,000 Seniors, 2008

Health Care Access

Health care access is essential for the overall well-being of seniors. Reliable, convenient access to primary care increases the capacity of seniors to live independently. The senior report measures health care access for seniors as a rate of the number of primary care physicians per 1,000 seniors. Primary care physicians frequently serve a demographically diverse patient base. However, primary care specialties are typically defined as: family practice, family medicine, general practice, internal medicine, general surgery, gynecology/obstetrics, and pediatrics. The physician’s professional registration database captures practice specialties and was matched to Missouri’s Bureau of Narcotics and Dangerous Drugs (BNDD) database, which requires physicians to report the counties in which they practice. Based on those data, the rate of primary care physicians per 1,000 seniors increased from a state rate of 7.1 in 2004 to 13.1 in 2008. In 2008 access to primary care physicians ranged from a low of no full-time primary care physicians practicing in Hickory County to more than 42 per 1,000 seniors in Boone County.

Status Indicators

Demographics

The proportion of seniors in Missouri’s population was 13.5 percent in 2000 and 13.6 percent in 2008. By 2015 the proportion of Missouri’s population aged 65 or older is projected to increase to 15.1 percent; by 2025, to 19.1 percent. Those proportions will be higher than the proportion of seniors in the nation overall. Missouri’s total population is 5,911,605. Between 2000

Introduction

and 2008, the state sustained a slow but steady 5.4 percent overall growth. The state's 65 and older population also grew relatively slowly during this period, from 755,837 in 2000 to 805,235 in 2008, an increase of about 6.5 percent. The first baby boomers will turn 65 in 2011, beginning a trend of relative growth in the senior population that will continue until 2030. An important characteristic of the senior population is that women outnumber men. In 2008, nearly 70 percent of Missourians age 85 or older were women. That gender difference is projected to moderate somewhat in the next 15 years. By 2015, women are projected to be about 68 percent of the 85 and older population; by 2025, 65 percent.

Quality of Life

Missouri Senior Report 2009 includes six measures from the U.S. Census Bureau that speak to the overall quality of life of seniors. By 2011, the U.S. Census Bureau's American Community Survey will release annual estimates for those measures for all Missouri counties. This year's report includes ACS estimates for counties with populations of 65,000 or more. For counties with a population smaller than 65,000, the Office of Social and Economic Data Analysis calculated estimates for 2008 based on current population estimates and ACS Public Use Microdata Area regional estimates.

Owner-Occupied Housing

Seniors' housing needs are more likely to be met if they live in owner-occupied housing. According to the ACS 2008 estimate, Missouri reported that 80.9 percent of seniors lived in owner-occupied housing, an increase of almost two percentage points from 2000. The rate ranged from 92.8 percent in Maries County to about 64.9 percent in St. Louis City.

Seniors Living in Families

Family life enhances the senior population's well-being. Seniors who live alone are more likely to be socially isolated and at greater risk of accidental injury and physical and mental illness. The census defines families as two or more related persons living in the same household. Persons residing in single person households are not reported as "families." In 2008, 62.6 percent of Missouri seniors lived in family households. By county, the number of seniors living in family households ranged from a high of 76.4 percent in Stone County to approximately 47.7 percent in DeKalb County.

Median Value of Owner-Occupied Housing

The ownership of a house represents a significant asset for most seniors, and the relative value of housing is a useful indicator of both seniors' and community assets. In 2008, the median value of owner-occupied housing in Missouri was \$141,500, up from \$89,800 in 2000. By county, the median value of housing ranged from a high of \$202,800 in St. Charles County to a low of \$48,255 in Worth County.

Seniors in Poverty

The proportion of seniors living in poverty is a direct measure of economic need. According to 2008 ACS-based estimates, 9.3 percent of Missouri seniors lived in poverty, compared to 9.9 percent in 2000. The poverty rate for seniors

Introduction

ranged from a low of 2.5 percent in St. Charles County to a high of nearly 22 percent in Sullivan County.

Average Income of Senior Households

In 2008, the average income estimate for Missouri's senior households was \$44,665, ranging from \$67,615 in Boone County to \$22,676 in Putnam County.

Seniors with a College Education

Seniors with a higher education generally tend to fare better on household and community wealth, and well-being. In 2008, an estimated 16.4 percent of Missouri seniors had completed a college education. The highest proportion of graduates – 36.5 percent – lived in Boone County. The lowest was 3.7 percent in both Schuyler and Ste. Genevieve counties.

Health and Wellness

The health and wellness of Missouri seniors can be gauged in several ways. This report focuses on seven indicators of long-term health and wellness that can be influenced by preventative practices and public health interventions. Because of variations in sample size and response rates at the county level, age-cohort specific reporting may vary from state-level estimates. Additional information about both regional and county-level data, as well as references about health indicators and health practices, can be found on the Missouri Department of Health and Senior Services' Web sites at www.dhss.mo.gov/CommunityDataProfiles/ and www.dhss.mo.gov/Health/index.html.

No Exercise, 2007

In 2007, 38.5 percent of Missouri seniors reported they did not exercise compared with the national rate of 32.5 percent. Individual counties ranged widely in the percentage of seniors not engaging in exercise. Fifty percent of Dunklin County seniors reported engaging in no exercise, while less than 24 percent of Webster County seniors reported limited physical activities.

No Sigmoidoscopy or Colonoscopy, 2007

Approximately 37 percent of Missouri seniors report not having a screening test for colon cancer (sigmoidoscopy or colonoscopy) within the past 10 years. Fifty-three percent of Worth County seniors had not undergone the screening within a 10-year period compared to slightly less than 14 percent in St. Louis City.

High Blood Pressure, 2007

About 40 percent of Missouri seniors reported a diagnosis of high blood pressure compared with 58 percent of seniors nationwide. The range within Missouri counties varied greatly. Consistent with national trends, 57 percent of New Madrid seniors reported receiving a diagnosis of high blood pressure. But only 27 percent of Cass County seniors reported receiving this diagnosis.

Obesity, 2007

Slightly more than 25 percent of Missouri seniors responding to the county-level study reported a body mass index (BMI) that indicated obesity, compared with 22 percent of seniors nationally. Thirty-seven percent of Clark County

Introduction

seniors reported their BMI in the obese range, compared to slightly less than 16 percent in Mississippi County.

Smoking, 2007

Approximately 11 percent of Missouri seniors reported they smoked, compared with 8.6 percent seniors nationally. The highest rate in Missouri was Madison County, where more than 21 percent of seniors reported smoking. Dade, Lafayette and Perry counties had the lowest number of reported senior smokers with 4 percent or less.

No Mammography, 2007

Of women age 65 and older surveyed through the 2007 county-level study, half reported not having a mammogram in the past year. Female seniors in Jackson County were the least likely to undergo the procedure, female seniors in St. Charles County the most likely.

High Cholesterol, 2007

About 25 percent of Missouri seniors reported having been told by a health care professional that they have high cholesterol levels. Mississippi County reported the highest percentage at more than 42 percent. Cooper and Cape Girardeau counties reported the lowest proportion of seniors with unhealthy cholesterol levels with less than 15 percent.

The Impact of Missouri Senior Tax Levies

Understanding the impact of a property tax levy on provision of senior services and quality of life for Missouri seniors

By Tina Uridge, Executive Director of Clay County Senior Services, Amber Moodie-Dyer, Research Assistant, OSEDA, Tracy Greever-Rice, Associate Director, OSEDA

Eight states, including Missouri and Ohio, use county property tax levies to help fund senior services. Yet, only Ohio has studied the services that are funded and the number of seniors helped (Payne, Applebaum, Molea & Ross, 2007).

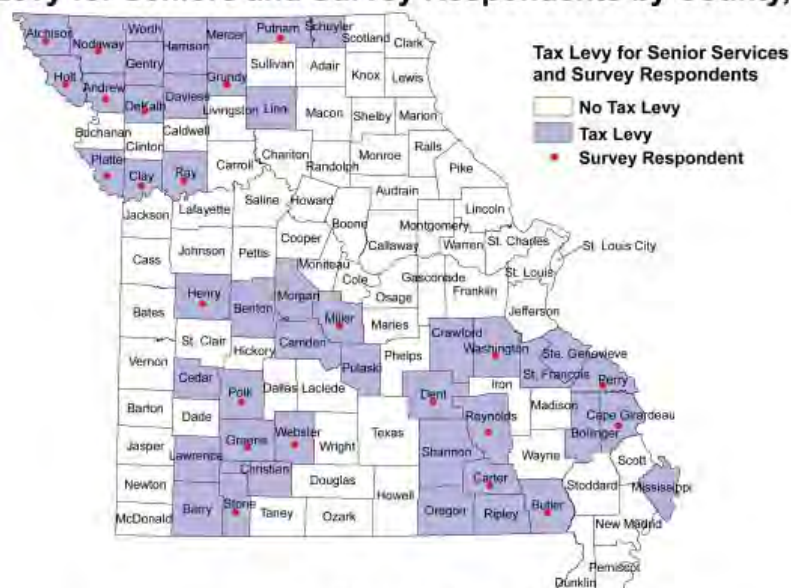

Missouri solicited this study to learn, as Ohio did, the affect tax levies have on the provision of senior services and to aid communities in meeting the needs of their growing senior population.

The survey captured the duration of, and level of support for, each county's levy, the dollar amount collected, and the number and types of senior services funded.

Who participated in this study?

This study is based on public information provided to the Missouri Department of Health and Senior Services from counties with tax levies that fund senior services. Forty-six of Missouri's 114 counties have such levies, and each was asked to complete a survey. Twenty-three did so, in 2008 and 2009, yielding a 50 percent return rate. The survey captured the duration of, and level of support for, each county's levy, the dollar amount collected, and the number and types of senior services funded.

The Impact of Missouri Senior Tax Levies

Two years ago, Norma was not sure whether she would ever return home.

Norma's story

Clay County, a participant in this study, illustrates how conducting a local needs assessment of older adults and their caregivers can identify which needs are not fully being met. For instance, Clay County learned that transportation is the greatest challenge for its older adults. Therefore, the county spent \$190,500, or 11% of its senior tax levy fund, to provide 5,640 medical appointment rides to 300 seniors in 2008.

Norma Haas, 91, an avid reader who begins her days doing crossword puzzles, is quick to tout the benefits of Clay County's tax levy fund. The fund has enabled her to receive care in her own home, which is the overwhelming care choice of older Americans. The care she receives is provided by her son, Jim, her primary caregiver for years.

Two years ago, Norma was not sure whether she would ever return home. Several falls left her with a fractured collarbone, hip and leg. It was a hard situation to accept for an adventurous woman who, in her seventies, still enjoyed scuba diving on the Great Barrier Reef and parasailing. After a tough rehabilitation, Norma struggled with depression. What kept her going was her desire to return home to Jim.

With the aid of the Clay County tax levy fund, Jim created a care plan that enables him to care for his mother at home and maintain a full-time job.

"The support from the county senior fund has been a blessing to us," says Jim. "My mom now has transportation to attend Brookside Adult Day Health Care two times per week and really enjoys it there—they have become her extended family."

On days Norma does not attend the adult day care center, she receives in-home respite care, partly paid by the tax levy fund.

Lori Childs, care manager with SeniorLink, a home care agency hired by the Clay County Senior Service Fund, said the plan had served Norma well.

"She has not fallen down in two years, has not been hospitalized, and is maintaining stable health," Childs said.

"That is the intended outcome of the services provided by the senior levy – to maintain quality of life by supporting seniors to safely age in place in their own homes and communities," said Tina Uridge, executive director

The Impact of Missouri Senior Tax Levies

of Clay County Senior Services.

History

Though property tax levies in Missouri have funded children's and mental health services for years, Missouri did not allow those levies to fund senior services until 1990. The levies are enacted on a county-by-county basis. They supplement public and private funding for senior services already in place.

Missouri did not allow levies to fund senior services until 1990.

For instance, Missouri has ten Area Agencies on Aging that provide nutrition programs, in-home services, legal services, disease prevention programs and transportation to people 60 and older (State of Missouri, Department of Health and Senior Services, n.d.). The agencies were created in 1973, the result of an amendment to the federal Older Americans Act (OAA) that mandates their existence in each state (Achenbaum, 2008).

Medicaid health services for qualifying Missourians 65 years or older have also been in existence for years, and are coordinated by the MO HealthNet Division (State of Missouri, Family Support Division, 2009). However, traditional funding streams such as Medicare, Medicaid and OAA have been stretched to their limits in times of federal budget crunches,

The Impact of Missouri Senior Tax Levies

according to Achenbaum. Thus, states have increased spending for coordination of senior services, program oversight and the development of local funding streams, including local funding from county property tax levies. Payne & Applebaum (2008) argue that such levies will be increasingly relied upon to support senior services.

Demographics of Study Participants

The 23 Missouri counties that participated in this study are distributed evenly throughout the state and are diverse in terms of population.^{1 2} Thirty-nine percent are U.S. Census Bureau-defined metropolitan counties, 17 percent are micropolitan counties, and 44 percent are rural. In 2007, their average county population was 43,096, with a range from 4,913 to 263,980. Their average senior population was 5,822, with a range from 950 to 35,964, and seniors comprised about 16 percent of their populations, with a range from 9 to 21 percent.

Most of the 23 counties seek geographic and professional diversity in their board members, who are primarily seniors.

The levies have been in place varying amounts of time. About 40 percent passed a tax levy prior to 2000, and about 60 percent passed one in the last eight years. On average, the levies were approved by a ratio of 60 percent to 40 percent.

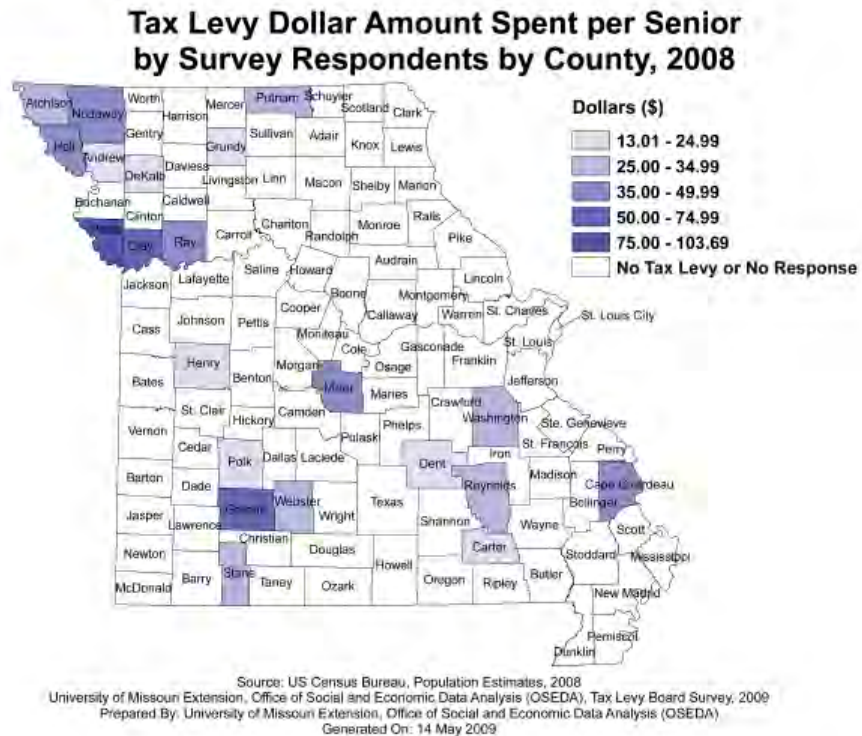

Slightly more than half the counties used a campaign committee to persuade voters to pass the levy. Most counties' voters approved the levy the first time it appeared on the ballot (91 percent). No county has repealed the levy. However, 43 percent report the tax has been rolled back slightly since passage.

Most counties collect \$.05 for every \$100 of property assessed. Over the last three years, the counties collected an average of \$303,988, with a range of \$12,243 to \$2,045,304. That large variance makes it important to note the median amount collected— \$87,589. Estimates from the U.S. Census Bureau and the American Communities Survey Program were used to determine that average spending per senior is \$37; the average amount per capita is \$5.

¹The 23 counties are: Andrew, Atchison, Butler, Cape Girardeau, Carter, Clay, DeKalb, Dent, Greene, Grundy, Henry, Holt, Miller, Nodaway, Perry, Platte, Polk, Putnam, Ray, Reynolds, Stone, Washington, and Webster (the senior tax in Perry County is from sales tax).

²Other Missouri counties with a mil tax for senior services were also contacted. They are: Barry, Benton, Bollinger, Camden, Cedar, Christian, Crawford, Daviess, Gentry, Harrison, Lawrence, Linn, Mercer, Mississippi, Morgan, Oregon, Pulaski, Ripley, Schuyler, Shannon, St. Francois, Ste. Genevieve, and Worth (the senior tax in Mississippi County is from sales tax).

The Impact of Missouri Senior Tax Levies

Who manages the property tax levy funds?

The property tax levy funds are managed by board members who are selected by county commissioners. The commissioners often use a formal application process to select the board members. In addition, 18 of the 23 county boards have bylaws. About half of the county boards meet at least once a month (11), while nine meet three to six times a year, and three meet once a year or as needed. Only two county boards employ paid staff, and the majority of boards place either the board treasurer or county treasurer in charge of the fund's accounting functions. Four of the 23 counties conduct an audit of the senior tax fund, in addition to the state's county audit. Each county uses about 3 percent of its fund for administrative purposes.

Most of the 23 counties seek geographic and professional diversity in their board members, who are primarily seniors. Board members' professions include health, education, government, business, military, homemaking, finance, social services, and farming, among others. Half of the counties have board members from at least four cities within their counties.

Almost all of the counties use a formal application process to determine

The Impact of Missouri Senior Tax Levies

which agencies will be funded through their senior service tax levies. About half use a request for proposal format; others have a rolling application process. All counties report that funding decisions are determined by their board members and that agencies who receive funding must provide a report at least once a year.

What type of services do the levies fund?

The top three agencies or providers who receive levy funding are, respectively, senior centers, transportation services and nutrition services. The following percentage of counties reported that their levies also fund these services:

- 1) Information and Referral – 24 percent;
- 2) Senior center administration and maintenance – 62 percent;
- 3) Home-delivered meals – 76 percent;
- 4) Home making/personal care/chores assistance – 43 percent;
- 5) In-home health care assistance (personal care/respite) – 33 percent;
- 6) Home medical equipment – 5 percent;
- 7) Home repairs – 33 percent;
- 8) Emergency response assistance – 33 percent;
- 9) Life enrichment programs/healthy aging/educational programs – 38 percent;
- 10) Alzheimer's/dementia – 10 percent;
- 11) Adult day care – 24 percent;
- 12) Caregiver services/support – 19 percent; and,
- 13) Case management – 19 percent.

Five counties report a waiting list for home making, personal care, and chores assistance.

Counties Coordinate Services with Other Agencies

Almost half of the counties coordinate services with Area Agencies on Aging or other agencies (43 percent). More than half allow fund recipients to make voluntary contributions to the fund. Thirty-two percent of the counties use senior services tax funds as a match to leverage funds from Older Adults Transportation Services, the Missouri Department of Transportation and the Older Americans Act.

Getting the Word Out

The counties use various media to inform their citizens about the benefits of property tax levies to fund senior services. Seventy-three percent use the newspaper or other media, 23 percent community presentations, and 18 percent use word of mouth or other agencies. One county used a senior tax levy board Web site; another did a mass mailing.

The Impact of Missouri Senior Tax Levies

The counties also use various methods to determine the needs of their seniors. Forty-five percent conducted a needs assessment; 68 percent reported using discussions with community leaders and service providers; and 55 percent also use constituent requests.

The biggest challenge for 50 percent of the counties is having more demand for senior services than they can fund. Other challenges include getting the word out to agencies and the community, finding experienced board members, and deciding which agencies to fund.

“In-home support services for those not eligible for Medicaid and for those not able to afford private-pay services are important to prevent premature institutionalization.”

Community Leaders Tout Benefits of Tax Levy Funds

Community leaders believe that tax levy funds allow local seniors to remain in their homes and communities longer.

“In-home support services for those not eligible for Medicaid and for those not able to afford private-pay services are important to prevent premature institutionalization,” one tax levy board chairman said.

“Our service providers are able to help those who might not otherwise be able to get help from any other source,” said another board chairman.

Conclusion

Despite evidence of the positive outcomes of tax levies to fund senior services, critics argue the funding creates an inequitable and fragmented system. This may be especially true in rural counties where the tax base is lower than in metropolitan counties, yet the proportion of seniors in the population is higher (Hornbostel, 2004). However, as federal and state funds continue to shrink in the current economic climate, local tax levies may be one of the only viable options to support a growing senior population. More research is needed to continue to examine and monitor the effects of the levies as they are passed and implemented in additional counties and states.

Health Disparities among Seniors

This paper is the fourth in a series published in the Missouri Senior Report that explores the nature and impact of health disparities by seniors' demographic and socioeconomic status. It provides an update on previous years' analyses and a description of Missouri's seniors (persons 65+) by race, ethnicity and gender.

A Trend Analysis of Race, Ethnicity and Gender

By Tracy Greever-Rice, Associate Director, OSEDA, Amber Moodie-Dyer, Research Assistant, OSEDA

Despite efforts over the last 10 years, health disparities still exist nationally across racial and ethnic groups in screening, mortality and treatment.

The United States began paying attention to racial and ethnic health disparities among its citizens more than a decade ago and implemented several efforts to address the problem (Gehlert, Mininger, Sohmer & Berg, 2008). In 1998, President Clinton created the “Racial and Ethnic Health Disparities Initiative.” In 2002, the U.S. Department of Health and Human Services launched the “Closing the Health GAP” campaign.

Those initiatives sought to raise awareness about how the following health conditions affect whites, blacks, and Hispanics differently: diabetes, heart disease, stroke, cancer, infant mortality, child and adult immunizations, and HIV/AIDS (DHHS, 2005).

Despite the initiatives, health disparities still exist nationally across racial and ethnic groups in screening, mortality and treatment (Gehlert et al., 2008). The senior population suffers more than any other group from diseases such as diabetes, heart disease, stroke and cancer.

The 2007 Missouri Senior Report examined ethnic and racial health disparities among Missouri seniors using death rate and diagnosis data from 2004 and 2005 (Greever-Rice & Hudson, 2007). More recent data, however, shows trends and changes in disease mortality for Missouri's white, black, Hispanic and non-Hispanic seniors. Overall, some gains have occurred in the last five years, but health disparities persist. The health conditions used in this analysis include heart disease, cancer, diabetes, Alzheimer's disease, kidney disease and hypertension.

Findings

Heart Disease

Heart disease is the leading cause of death among Missouri seniors and it strikes fairly evenly across racial, ethnic and gender lines. In addition,

Health Disparities among Seniors

the total death rate from heart disease shows a trend of decline from 2003 (1770.5 per 100,000) to 2007 (1462.3 per 100,000).

Black male seniors are almost 40 percent more likely to die from cancer than white male seniors.

Cancer

Cancer, the second leading cause of death for Missouri seniors, shows more disturbing results in terms of racial and gender disparity. Black male seniors, for example, are almost 40 percent more likely to die from the disease than white male seniors (1844.3 death rate vs. 1109.2 death rate). Yet overall cancer death rates for black seniors (1333.9) are only modestly higher overall compared to white seniors (1109.2). The reason is that cancer death rates are much closer between black female seniors (1025.4) and white female seniors (917.9).

Health Disparities among Seniors

Diabetes

The diabetes death-rate disparity between black and white seniors persists. Rates are almost twice as high for black seniors (275.9) compared to white seniors (134.2). However, diabetes death rates have decreased for both groups over the last five years: for white seniors, from 147.4 in 2003 to 123.7 in 2007; for black seniors, from 297.4 in 2003 to 245.3 in 2007.

But gender plays a significant role in the diabetes death rate for blacks. Black senior men are much more likely to die from diabetes than black

Health Disparities among Seniors

senior women; in fact, their death rates surpassed black women's death rates in both 2006 and 2007.

Kidney disease

The death-rate disparity for kidney disease between black and white seniors also has persisted. African-American seniors have about a 35 percent higher death rate than white seniors, regardless of gender.

Health Disparities among Seniors

Source: Death MICA, Missouri Department of Health & Senior Services, 2007

Figure 8. 2003-2007 Kidney Disease Death Rates by Race and Gender, 65+

Source: Death MICA, Missouri Department of Health & Senior Services, 2007

Hypertension

The biggest reduction in health disparity between black and white seniors has occurred in deaths caused by hypertension. Though the death rate of white seniors has stayed fairly constant over the last five years, about 44 per 100,000, the death rate of black seniors has decreased—from 112.9 in 2003 to 77.2 in 2007. Although a significant disparity still exists, the gap is shrinking.

Health Disparities among Seniors

The biggest reduction in health disparity between black and white seniors has occurred in deaths caused by hypertension.

Figure 9. 2003-2007 Hypertension Death Rates by Race and Ethnicity, 65+

Source: Death MICA, Missouri Department of Health & Senior Services, 2007

Figure 10. 2003-2007 Hypertension Death Rates by Race and Gender, 65+

Source: Death MICA, Missouri Department of Health & Senior Services, 2007

Alzheimer's disease

The Alzheimer's disease death rate affects white seniors and women more dramatically than other groups. For instance, women have higher death rates from Alzheimer's disease than black or white men. For both races, Alzheimer's disease death rates are increasing. But the rates have increased 60 percent for blacks from 2003 to 2007, a dramatic jump when compared to a 25 percent increase for whites during the same period. The disease's dramatic increase among blacks is attributed to black women. However, whites still had a higher overall Alzheimer's death rate than blacks in 2007: 218.5 per 100,000, compared to 145.8 per 100,000, respectively.

Health Disparities among Seniors

The findings suggest a mixed record on efforts to reduce racial and ethnic health disparities among Missouri seniors in the last five years. Improvements include an overall death-rate decline for seniors in heart disease and diabetes. In addition, hypertension death rates in black seniors have declined, and the diabetes death rate in black women has also decreased. However, disparities still persist and have widened for certain diseases. Black male seniors, for instance, are dying from cancer at a much higher rate than black female seniors and white seniors. In addition, while the diabetes death rate has declined for black women, it has increased for black men. Black men and women still have significantly higher diabetes death rates than white seniors. Another disturbing trend is the Alzheimer's death-rate increase among black women, though the black death rate remains lower than the Alzheimer's death rate in the white population overall.

The Alzheimer's disease death rate affects white seniors and women more dramatically than other groups.

Health Disparities among Seniors

Seniors who receive little or no treatment for chronic diseases experience a poorer quality of life. They and their families ultimately incur higher health care costs.

Implications

These findings have substantial implications for Missouri seniors in terms of public policy, disease prevention, screening, and treatment programs. Disparities based on race and gender still persist. Seniors who receive little or no treatment for chronic diseases experience a poorer quality of life. They, and their families and communities, ultimately incur higher health care and long-term care costs. Progress has occurred in the death-rate disparity between whites and blacks on hypertension. Effective policy initiatives that focus on preventative care and lifestyle changes may explain the gain. More studies need to be conducted to understand how prevention and treatment barriers may contribute to the disparities.

How to Use the Senior Report

What is an outcome indicator?

An outcome indicator represents an issue important to the overall well-being of seniors in your community, such as seniors' economic well-being and access to health care.

What is an outcome measure?

An outcome measure is the specific item that indicates how well seniors are doing in regard to an issue. For example, 'Primary Care Physicians per 1,000 Seniors' is the outcome measure for the outcome indicator, 'Health Care Access'. In order to be included in the Senior Report, all measures must be available on an annual basis and collected in a consistent manner across counties, allowing for both comparison over time and between counties.

What is a status indicator?

A status indicator describes the characteristics of the senior population in a county at a single point in time. A status indicator provides context for understanding and prioritizing the outcome indicators.

What is an index?

An index is a tool that combines more than one measure into a single value by converting different units of measurement into a standard unit of measurement. An index is used to describe an indicator when single measures are unavailable.

How do I interpret the county rank?

The county rank for an outcome indicator represents the relative position of a county in the context of all 114 Missouri counties and St. Louis City with "1" indicating the most positive finding.

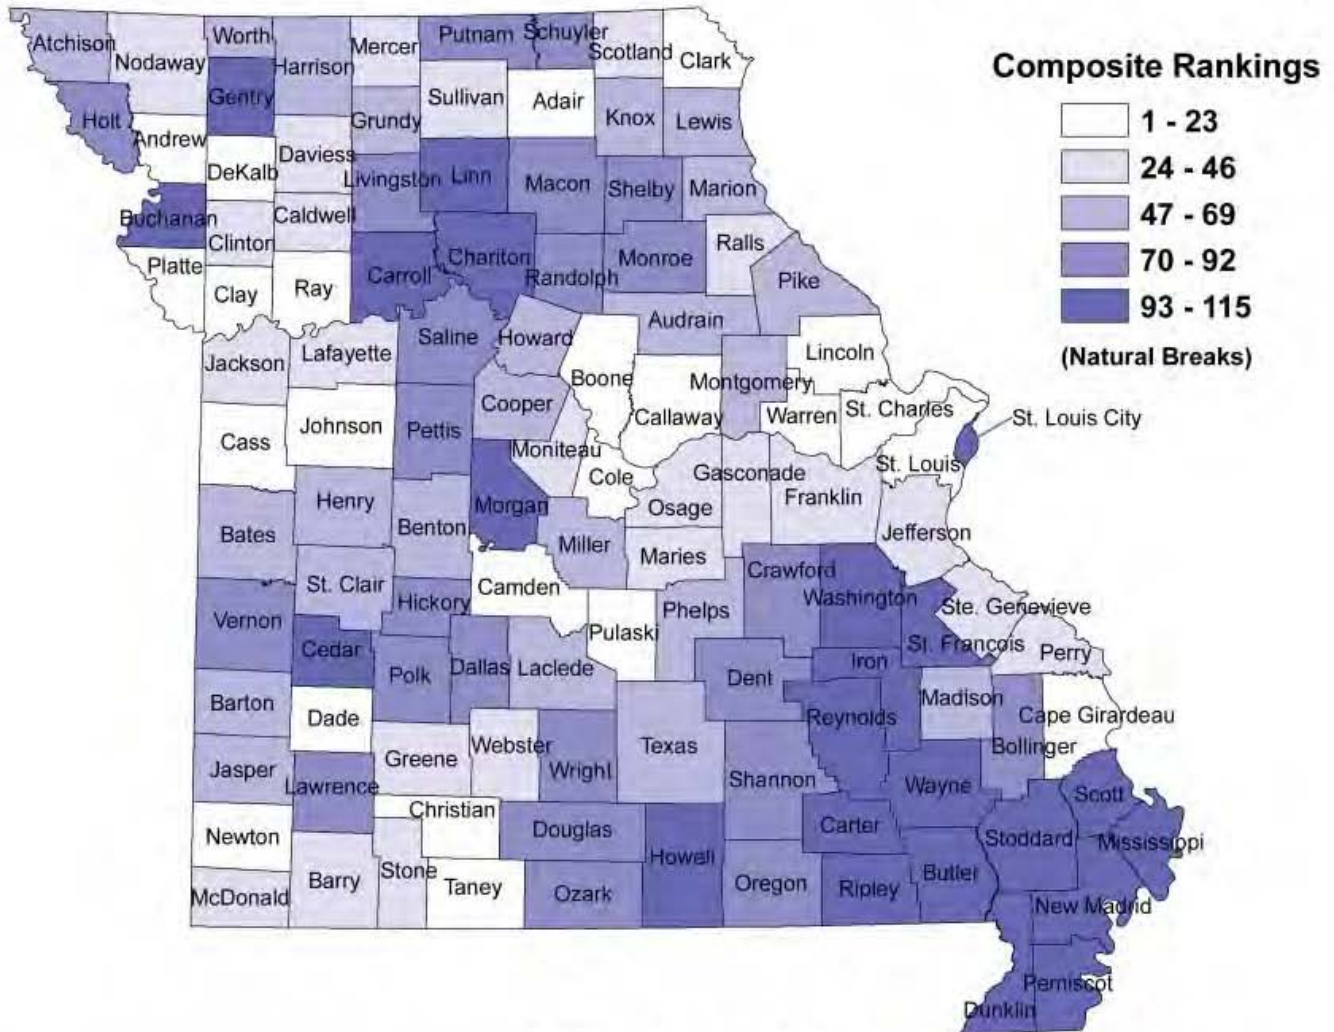

Tables are also included that organize counties and rankings by three general categories of population density as defined by the U.S. Census Bureau: metropolitan (county or adjacent county with urbanized area 50,000+), micropolitan (county or adjacent county with urbanized area 10,000 – 50,000), and rural (county with no urbanized area >10,000).

How do I interpret the composite rank?

The composite county rank is an index of the sum of the standardized outcome measures and represents the relative position of a county in the context of all 114 Missouri counties and St. Louis City with "1" indicating the highest overall score. The economic contribution and long-term care costs indicators are not calculated in the composite rank due to variation in local economies.

Glossary of Indicators

Economic Well-being

Supplemental Security
Payments as Percent of Total
Personal Income

Glossary of Outcome Indicators

Supplemental security income (SSI) payments are income-based benefits available to seniors and persons with disabilities. In 2006, the SSI benefit for an individual who lived alone and had no other income was 73 percent of the poverty line. People with countable assets of more than \$2,000 for an individual and \$3,000 for a couple are ineligible for SSI. *Source: Research & Evaluation, Missouri Department of Social Services, 2007*

Workforce Participation

Percentage of Seniors Working
for Pay

The percentage of persons aged 65 or over in a county working for wages as calculated by averaging the number of persons 65+ working for wages during each quarter of 2007. *Source: The Longitudinal Employer–Households Dynamic Program, Missouri Economic Research & Information Center, Missouri Department of Economic Development, 2007*

Economic Contribution

Economic Impact Index

Calculation is based on the ratio between average household income and average household expenditures by age cohorts 65+ and <65. The expenditures for the two groups are then attributed to the ratio of the two age groups in a county. *Sources: U.S. Bureau of the Census, American Community Survey 2008, Consumer Expenditure Survey, Bureau of Labor Statistics, 2007*

Housing

Percentage of Seniors Housing
Cost Burdened

Percentage of persons 65 and older who spend 30 percent or more of their monthly income on mortgage payments or rent and utilities combined. *Sources: American Community Survey, U.S. Bureau of the Census 2008; Office of Social & Economic Data Analysis ACS Estimates, 2008*

Transportation

Percentage of All Seniors with
Missouri Driver's License

The percentage of seniors with a valid Missouri driver's license. *Source: Division of Motor Vehicle and Drivers Licensing, Missouri Department of Revenue, 2008*

Household Composition

Seniors Filing Missouri Joint
Income Tax Returns

Percentage of seniors living in households where head of household did not file as 'single'. *Source: Division of Taxation & Collection, Missouri Department of Revenue, 2007*

Civic Engagement

Senior Voters Index

The percentage of seniors who were registered to vote or voted in an election during past year. *Source: Missouri Secretary of State, 2008*

Glossary of Indicators

Long-Term Care

Medicaid Costs for Long-Term Care per 1,000 Persons

Total Medicaid dollars spent on in-home and residential long-term care services per capita. *Source: Section for Long-term Care Regulation, Division of Senior & Disability Services, Missouri Department of Health & Senior Services, 2008*

Safety

Crime and Senior Abuse per 1,000 Persons

The number of property and violent crimes and senior abuse hotline calls per 1,000 persons. *Source: The Missouri Statistical Analysis Center, Missouri Department of Highway Patrol, Missouri Department of Public Safety, 2008*

Health Status

Hospitalization & ER Visits for Diabetes per 10,000 Seniors

The number of hospital and emergency room visits made per 10,000 seniors regarding diabetes and issues associated with diabetes. *Source: Data, Surveillance Systems, & Statistical Reports, Missouri Department of Health & Senior Services, 2005-2007*

Health Care Access

Primary Care Physicians per 1,000 Seniors

The number of physicians providing primary care services full or part time in a county per 1,000 seniors. *Source: Missouri Division of Professional Registration database and the Missouri Bureau of Narcotics and Dangerous Drugs (BNDD) database, 2008*

Demographics

Total Population

Glossary of Status Indicators

Measures the total population for the years of 2000, 2008, 2015 and 2025. *Source: Table 2a. Projected Population of the United States, by Age and Sex: 2000 to 2050, "U.S. Interim Projections by Age, Sex, Race, and Hispanic Origin," U.S. Census Bureau, 2008*

Change in Total Population

A measure of the change in population between 2000 and 2008. *Source: Table 2a. Projected Population of the United States, by Age and Sex: 2000 to 2050, "U.S. Interim Projections by Age, Sex, Race, and Hispanic Origin," U.S. Census Bureau, 2008*

Population 65+

A measure of the total population that is 65 years old or older. *Source: Table 1, Annual Estimates of the Population by Sex and Five-Year Age Groups for the United States: April 1, 2000 to July 1, 2008. Population Division, U.S. Census Bureau*

Percentage of Population 65+

A measure of the percentage of the total population that is 65 years old or older. *Source: Table 1, Annual Estimates of the Population by Sex and Five-Year Age Groups for the United States: April 1, 2000 to July 1, 2008. Population Division, U.S. Census Bureau*

Glossary of Indicators

Population Projections 65+

A measure of the male and female population 65 years old or older for 2015 and 2025. *Sources: Population projections are produced by OSEDA by using 2008 NCHS estimates for demographic cohorts. Cohort-survival ratios by race and sex were calculated as five-year intervals using 1990 and 2000 census data as well as 2001-2008 estimates.*

Quality of Life

Seniors in Owner-Occupied Housing

The percentage of persons 65 years old and older living in owner-occupied housing.

Seniors Living in Families

The percentage of persons 65 years old and older living in families.

Median Value of Own House

A measure of the median value, in dollars, of owner-occupied housing for persons 65 years old and older.

Seniors Living in Poverty

A measure of the percentage of persons 65 years old and older living in poverty.

Average Income of Senior Households

A measure of the annual average household income, in dollars, for persons 65 years old and older.

Seniors with a College Education

A measure of the percentage of persons 65 years old and older with a college degree or higher.
Sources: American Community Survey, U.S. Bureau of the Census 2008; Office of Social & Economic Data Analysis ACS Estimates, 2008

Health and Wellness

No Exercise

A measure of the percentage of seniors who responded that they had not performed some sort of non-work related exercise during the past month.

No Sigmoidoscopy or Colonoscopy

A measure of the percentage of seniors who responded that they have not had a sigmoidoscopy or colonoscopy exam in the past 10 years.

High Blood Pressure

A measure of the percentage of seniors who have been told they have high blood pressure by a doctor, nurse, or other health professional.

Obesity

A measure of the percentage of seniors who have a body mass index greater than 25.00 (Overweight or Obese).

Smoking

A measure of the percentage of seniors who are current smokers.

No Mammography

A measure of the percentage of senior females who have not had a mammogram in the past year.

High Cholesterol

A measure of the percentage of seniors who had their cholesterol checked and have been told by a doctor, nurse, or other health professional that it was high.
